Creating the Database

As you open the folder, you will see 2 sql files in the main directory, these being project.sql and data.sql. Feel free to change project.sql's tables' values. Make sure that GenderOptions.txt is also in this directory.

Open your PSQL, logging in as postgres. Paste all the code in project.sql into the command line, then after doing that, Paste all the code in data.sql.

After that you are ready to run the program!

Running the program

Open up your command line and change the directory to the main folder (where you can see all the different files right before the edu.ucalgary.oop package)

Then to compile the tests and classes, run the following commands

javac -cp ".;path\to\hamcrestcore;path\to\junit;path\to\postgresql" edu\ucalgary\oop*.java

java -cp ".;path\to\hamcrestcore;path\to\junit;path\to\postgresql" org.junit.runner.JUnitCore edu.ucalgary.oop.TestName

Running the interface

Keep running your command line in the same directory and run the following commands

If you want to start as a Central Relief Worker:
javac -cp ".;path\to\hamcrestcore;path\to\junit;path\to\postgresql" edu\ucalgary\oop\CentralReliefWorkerInterface.java

java -cp ".;path\to\hamcrestcore;path\to\junit;path\to\postgresql" edu.ucalgary.oop.CentralReliefWorkerInterface

If you want to start as a Location Relief Worker:
javac -cp ".;path\to\hamcrestcore;path\to\junit;path\to\postgresql" edu\ucalgary\oop\LocationReliefWorkerInterface.java

java -cp ".;path\to\hamcrestcore;path\to\junit;path\to\postgresql" edu.ucalgary.oop.LocationReliefWorkerInterface
